

BIZDATA

Bank Reports Intelligence System

COMPLETE MANUAL

Every module, every sub-page, and all four decision-support phases — in one document

25 modules · 6 sub-page deep-dives · 4 phases · live screenshots · 3 July 2026

Part I — Introduction

BIZDATA is a multi-source data-intelligence platform that estimates recoverable tax revenue from underdeclaration. It ingests structured data from banks and other providers, matches it to taxpayers, compares observed flows against declared income, and turns the gaps into a prioritised, auditable enforcement worklist.

This is the single complete reference. Part II documents every module with a live screenshot; Part III drills into sub-pages; Part IV covers the four decision-support phases. All figures come from the running system (48 providers, 911 taxpayers, 7,451 records, ~700 cases, 2,076 AI signals).

How it fits together

Providers submit files (Submissions) → parse into Data Records → a Scan aggregates per taxpayer vs Declared Income → gaps become Flagged Review → promoted into Cases → Cross-State hands off out-of-jurisdiction ones. Analytics shows where the intelligence and gaps are; the Tax-Net comparative shows who is in the net and lets you bring them in; Portfolios route work to a named owner; Identity Resolution closes the identity gap. Audit Logs, Sensitive Access and Data Protection keep it accountable; Users and Settings govern access.

Part II — The Modules

Every left-menu item, in order.

1. Dashboard

The command centre — recoverable-revenue position and system health at a glance.

What it does

- Money-first KPIs: revenue at risk, recovered, open cases, critical-risk count.
- Operations strip: provider compliance, open alerts, audit integrity, cross-state referrals.
- Detection→recovery funnel, risk distribution, top cases, and the six AI analytics agents (Run agents).

Why it is useful

The first screen each day — answers "how much can we recover and what needs attention" with no clicks.

2. Data Providers

A risk-ranked compliance dashboard for the \$29 data providers.

What it does

- KPI row + a quarterly compliance heatmap (provider × Q1–Q4, colour-coded).
- At-risk callout for providers with missing submissions.
- Step-up-authorized uploads viewer + CSV export.

Why it is useful

Shows who must report, who has, and who is behind. Each provider has its own detail dashboard at /providers/[id].

3. Tax Payer Data

The registry of every individual and corporate tracked.

What it does

- Searchable by name, NIN, RC, TIN; filterable by type and status.
- PII (NIN/BVN/TIN) stored encrypted; list shows safe identifiers only.
- CSV import and individual add.

Why it is useful

The master list — every case, record and declaration links back to a taxpayer here.

4. Taxpayer 360

One unified view of a single taxpayer across every data source.

What it does

- Search by name, TIN, NIN, BVN or CAC.
- Declared income, observed flows, cases and risk in one place.

Why it is useful

The single-pane-of-glass for investigating one entity (see the taxpayer deep-dive later).

The screenshot displays the 'Taxpayer 360' interface. At the top right, there is a user profile for 'Super Admin' with a dropdown arrow. Below this, the title 'Taxpayer 360' is followed by a subtitle: 'Search by name, TIN, NIN, BVN or CAC number — one view of declared income, observed flows, cases, and risk.' A search bar with the placeholder text 'Search taxpayers...' is positioned on the left, and a green 'Search' button is on the right. The main content area is currently empty.

5. Tax Net

Who is in the tax net and who isn't — with registration into the net. (Phase 2)

What it does

- Classifies every party as Captured / Unverified / Invisible against its truth-of-record ID (RC / TIN).
- Ranked by observed inflow; source-provider column; identity pips.
- Register manually per-row or auto/bulk; also hosts the Phase-4 identity-resolution strip.

Why it is useful

The board-level headline: of everyone receiving money, who is registered — and bring the rest in.

6. Analytics

Analysis by provider and by sector. (Phase 1)

What it does

- By provider: volume, value, data quality (rejection, identity completeness), yield /1k.
- By sector: underdeclaration concentration, tax-net coverage, estimated recoverable tax.

Why it is useful

Where the intelligence and the gaps are — the comparison that drives decisions.

7. Declared Income

The annual income declarations the scan compares against.

What it does

- One declaration per taxpayer per year; CSV import.
- Observed flows minus declared income = the discrepancy.

Why it is useful

The "declared" side of the equation — without it the scan cannot measure true underdeclaration.

SA Super Admin
SUPER ADMIN

Declared income

Annual income declarations used in underdeclaration scans.

↑ Import CSV

Year

All years

No declared income recorded for that filter.

8. Submissions

Every data file uploaded by a provider (or staff on their behalf).

What it does

- Period, provider, status, and accepted/rejected counts.
- Each parsed into records and issued a \$6.5 acknowledgment receipt.

Why it is useful

The audit trail of what data came in, when, from whom, and whether it passed validation.

SA Super Admin
SUPER ADMIN

9. Compliance

NTAA §29 reporting-obligation tracking across all providers.

What it does

- Derives required periods, computes the statutory due date (15 days after period end).
- Marks each period on-time / late / missing; reports rate + data quality.

Why it is useful

The formal obligation ledger behind the provider dashboard.

10. Cross-State

JRB Act 2025 §15 referrals of non-FCT-resident taxpayers.

What it does

- Minimised referral (TIN + amounts only); tracks outbound + inbound.

Why it is useful

Hands cases to the right jurisdiction while sharing the least data necessary.

SA Super Admin
SUPER ADMIN

Cross-state referrals

JRB Act 2025 §15 — refer non-FCT-resident taxpayers to their home State IRS (minimised data: TIN + amounts only).

2025

Draft referrals (0)

CANDIDATES — NON-FCT RESIDENTS WITH FLAGGED CASES

No outstanding candidates for 2025 (all referred or FCT-resident).

REFERRALS

No referrals yet.

11. Data Records

Every individual ingested row across every provider type.

What it does

- Raw normalised records: account, identifiers, inflow/outflow, period.
- Filterable by flag and review status; links to taxpayer + submission.

Why it is useful

The lowest-level evidence layer behind every case and flag.

SA Super Admin

12. Cases

The prioritised worklist of taxpayers whose observed flows exceed declared income.

What it does

- Ranked by estimated recoverable tax; observed, declared, est. tax, confidence, risk.
- Lifecycle: detected → review → notice → objection → confirmed → settled → recovered.

Why it is useful

The heart of enforcement (see the case deep-dive later).

SA Super Admin
SUPER ADMIN

Underdeclaration cases

13. Flagged Review

Records flagged by a scan and still awaiting a human decision.

What it does

- Taxpayer, provider, period, observed vs declared, discrepancy.
- Clear or Confirm each; a confirmed flag feeds the case pipeline.

Why it is useful

The human-in-the-loop checkpoint — no automated flag becomes a case without review.

SA Super Admin
SUPER ADMIN

14. Scans

Runs the underdeclaration analysis: aggregate inflows per taxpayer vs declared.

What it does

- Configurable by year and threshold; aggregates across ALL providers.
- Produces flagged records, risk scores, estimated recoverable tax.

Why it is useful

The engine that turns raw provider data into leads. Re-runnable when new data lands.

SA Super Admin
SUPER ADMIN

Underdeclaration scans

Aggregate provider inflows per taxpayer, compare to declared income, flag the gap.

15. Agent Signals

Every AI-agent finding across all taxpayers, filterable. (New)

What it does

- Per-agent summary + severity filters (HIGH/MEDIUM/LOW).
- Each signal with its plain-language explanation and a link to the taxpayer.

Why it is useful

The AI analytics "report" in one place — no longer buried inside individual cases.

16. Schemas

The CSV column expectations applied when a submission is ingested.

What it does

- One schema per provider type (incl. Insurance).
- Every schema now also accepts common sector + businessType columns.

Why it is useful

The config that lets many provider file layouts flow into one normalised model.

SA Super Admin
SUPER ADMIN

Provider schemas

CSV column expectations applied during submission ingestion. One schema per provider type.

18. Alerts

High-value flags, missing submissions, deadlines — and case assignments.

What it does

- Auto-generated alerts; now also per-user CASE_ASSIGNED notifications (Phase 3).
- Marked read/unread; dashboard shows the unread count.

Why it is useful

The push channel for time-sensitive items and work routed to you.

19. Model & Fairness

Detection precision and the distribution of flags, to monitor disparate impact.

What it does

- A precision proxy; flag distribution across segments.

Why it is useful

Governance over the analytics itself — accuracy and fairness of the model.

20. Governance

The steering-committee report pack and bank MoU / onboarding status.

What it does

- Generated oversight report pack; tracks MoUs and onboarding.

Why it is useful

The board-level view — programme status and the agreements underpinning data sharing.

21. Sensitive Access

Just-in-time, supervisor-approved access to masked PII.

What it does

- BVN + full account numbers masked by default; time-boxed access with approval; audited.

Why it is useful

The controlled gateway to the most sensitive fields — deliberate, temporary, logged.

SA Super Admin
SUPER ADMIN

Sensitive-data access
BVN and full account numbers are masked by default. Request time-boxed Just-in-Time access; a supervisor must approve.

My access
You currently see BVN and account numbers **masked**.

Business justification (e.g. 'Case #1024 — verify BVN before issuing notice')

Request 30-minute access

Pending approvals
No pending requests.

22. Data Protection

NDPA 2023 oversight: lawful basis, access events, storage-limitation.

What it does

- Records lawful basis; surfaces PII access events; retention + purge.

Why it is useful

The privacy-compliance console — demonstrates the programme meets the law.

23. Portfolios

Analyst ownership of providers / types / sectors, with auto-routing. (Phase 3)

What it does

- Own an individual provider, a provider type, or a sector.
- New cases auto-route to the owner (provider beats type beats sector); the analyst is notified.
- Per-analyst workload: open cases, revenue at risk, portfolio count.

Why it is useful

Puts a named owner on every provider/type/sector so no lead falls between desks.

SA Super Admin
SUPER ADMIN

ANALYST PORTFOLIOS

Who owns what — and their workload

Give an analyst a book of work — a specific provider, a provider type, or a sector. New flagged cases route to the owner automatically (provider beats type beats sector) and the analyst is notified.

Observed flows - 2026 (100 records)

[illegible]

- Al analytics signals (4)**
 - 100% Sector Classification**
Inferred sector trading (confidence 100%). Observed inflow is 437198648.51x the sector median (45,359,359,783 vs 104). No income declaration on file.
 - 100% Pattern Detection**
Inflows land on suspicious round figures (exact multiples of N100,000,000), a pattern typical of cash-intensive trading. Only per-account period aggregates are available; so individual sub-threshold deposits cannot be observed directly; review underlying statements to confirm.
 - 60% Predictive Compliance**
Estimated recoverable exposure of N45,359,359,783 with an estimated 35% voluntary-settlement likelihood for this corporate taxpayer. PURSUE_WITH_ENFORCEMENT: large exposure but low settlement propensity; expect to escalate. No declaration on file, so full observed inflow is treated as unexplained. Identity-match confidence/footprint data is thin, so the likelihood estimate is low-confidence.
 - 50% TIN-BVN Matching**
Identity-match confidence is unavailable on every linked account; verify the TIN/BVN linkage manually before relying on this profile for enforcement.

The anchor when investigating one person or company.

Submission detail (Submissions → a file)

One uploaded file and how it was processed.

What it shows

- File metadata, record counts, validation outcome, \$6.5 receipt hash.

Why it matters

Proves exactly what a provider sent and how it validated.

The screenshot shows the 'Submission detail' page for 'Submission c6020928' in the BizData interface. The left sidebar contains a navigation menu with items like Dashboard, Data Providers, Tax Payer Data, Taxpayer 360, Tax Net, Analytics, Declared Income, Submissions (highlighted), Compliance, Cross-State, Data Records, Cases, Flagged Review, Scans, Agent Signals, Schemas, Audit Logs, Alerts, Model & Fairness, Governance, Sensitive Access, Data Protection, Portfolios, Users, and Settings. The main content area displays submission details for 'UNITRUST INSURANCE COMPANY LIMITED - period 2026-Q2'. It includes a status of 'REJECTED', a period of '2026-Q2', 1 record, and 0 accepted/1 rejected. The file is 'json-2026-Q2.json' (158 B), received on '03 Jul 2026, 18:27', and processed on the same date. A 'Validation errors' section shows a JSON message: 'policyNumber required'. Below, the 'Records in this submission (0 shown)' section indicates 'No records associated with this submission yet.'

No records associated with this submission yet.

Data-record detail (Data Records → a row)

One normalised transaction row, fully expanded.

What it shows

- Account/identifier fields, inflow/outflow, period, match method.
- Links to taxpayer + submission; flag/review status.

Why it matters

The atomic unit of evidence — a single number traced to its source.

Scan detail (Scans → a run)

The result summary of one underdeclaration scan.

What it shows

- Parameters (year, threshold); outcome counts; status + timing.

Why it matters

The provenance of a batch of flags — which run produced them and how.

The screenshot displays the BizData interface for a scan. On the left is a dark sidebar with a navigation menu. The main content area shows the details for 'Scan 3002f131'.

Navigation Menu (Left Sidebar):

Provider detail (Data Providers → a provider)

A single provider’s compliance dashboard.

What it shows

- Compliance KPIs + a four-quarter reporting timeline (due vs received).
- Portal users, recent submissions, and the gated uploads viewer.

Why it matters

Everything about one provider’s reporting behaviour in one place.

Part IV — Decision-Support Phases

Four phases that turn a flag list into a decision-support system.

Phase 1 — Comparative Analytics

The Sector Classification agent computed a sector but never saved it — persisting it unlocked the sector dimension (0 → 911 classified). Two aggregation views turn 7,451 records into comparison: by-provider (volume, quality, yield) and by-sector (underdeclaration concentration, coverage, recoverable tax). Example: Hospitality shows 92% flagged with 31% coverage — a clear target.

Phase 2 — Tax-Net Comparative

Classifies every observed party as Captured (has RC/TIN), Unverified (registered, ID missing), or Invisible (receiving money, no registration), ranked by inflow. Registration into the net is available per-row (manual) or auto/bulk, assigning a provisional TIN — every action audited. A source-provider column shows where each party’s data came from.

SA Super Admin
SUPER ADMIN

TAX-NET COMPARATIVE

Who is in the tax net — and who isn't

Every observed party classified against its truth-of-record identifier (RC for companies, TIN for people), ranked by observed inflow. Register the invisible and unverified into the net — one at a time, or in bulk.

Resolve identities — 901 taxpayers have a BVN but no NIN

Bridge each BVN to its linked NIN via the identity service to bring them a step closer to the net. 10 already verified. Running in demo mode — NINs are synthetic until NIBSS is connected.

ILERA OILS AND FAT LTD OTHER	CORPORATE	WEMA BANK PLC	TIN RC BVN NIN	₦8,038,624,506	Captured	✓ in net
A.A. MAJID MULTITRADE VENTURES TRADING	CORPORATE	WEMA BANK PLC	TIN RC BVN NIN	₦7,112,042,099	Captured	✓ in net

Phase 3 — Analyst Portfolios

An analyst owns a book of work — a specific provider, a provider type, or a sector. New flagged cases auto-route to the owner by precedence (specific provider beats type beats sector); manual assignments are never overridden. On assignment, a CASE_ASSIGNED notification is addressed to that specific analyst (per-user targeting was added to the platform). Verified: assigning WEMA to an analyst routed 51 cases and created 51 targeted notifications.

SA Super Admin
SUPER ADMIN

ANALYST PORTFOLIOS

Who owns what — and their workload

Give an analyst a book of work — a specific provider, a provider type, or a sector. New flagged cases route to the owner automatically (provider beats type beats sector) and the analyst is notified.

PORTFOLIO ASSIGNMENTS

OWNER	SCOPE	OWNS	ACTION
ABDULLAHI MUHAMMAD SULEIMAN anayaro2019@gmail.com	Provider	WEMA BANK PLC	Remove

Routing precedence: a case matching an owner's **specific provider** wins over one matching a **provider type**, which wins over a **sector**. Manually-assigned cases are never overridden.

Phase 4 — Identity Resolution (NIMC / NIBSS)

~90% of individuals have no TIN and no NIN, but every one has a BVN. NIBSS bridges a BVN to its linked NIN, moving the individual toward the net. Built as a pluggable IdentityProvider interface with a deterministic mock for development and a NIBSS stub for production — swapping is a config change (IDENTITY_PROVIDER=nibss), not a rewrite. Single + bulk resolution, both audited; demo NINs clearly labelled synthetic. The control lives on the Tax-Net page.

/tax-net

Part V — Notes & known limitations

Provider compliance reads low — by design

Statutory quarterly due dates have passed without on-time filing. The 15-day/quarterly rule is a configurable default (\$29/\$6.6) and should be confirmed against the gazetted NTAA text.

Underdeclaration figures

The scan aggregates each taxpayer's inflow across all providers vs a single declared-income figure. Because real declared-income data is not yet loaded, most taxpayers hit the "no declaration" branch, treated as a 100% gap — so extreme percentages and huge sector ratios appear. Read flags as "has observed inflow, no filing on record" until declarations are loaded. Provisional TINs and mock NINs are clearly labelled and must be confirmed against FIRS / NIMC / NIBSS before they are authoritative.
